

Condensed Instructions

Secchi Depth

(shady side of the boat, no sunglasses)

1. Lower the disk until it disappears
2. Raise it until it reappears
3. Record the midpoint of these 2 depths in tenths of a metre e.g. 4.2m

Taking the water sample

1. Rinse the two tubes and small jar twice with a bit of lake water
2. Lower the sample bottle to the Secchi depth. Stay clear of the lake bottom (if this happens to be close to the Secchi depth).
3. Pour water through the filter to fill the two tubes and the small jar. (You may need to take two samples to fill all of the bottles)

Make sure the lids are snug
